

Pattern - 3: Right-Angled Number Pyramid

Problem Statement: Given an integer **N**, print the following pattern :

```
1
12
123
1234
12345
```

Here, $N = 5$.

Examples:

Input Format: $N = 3$

Result:

```
1
1 2
1 2 3
```

Input Format: $N = 6$

Result:

```
1
1 2
1 2 3
1 2 3 4
1 2 3 4 5
1 2 3 4 5 6
```

Solution

Disclaimer: *Don't jump directly to the solution, try it out yourself first.*

Approach:

There are 4 general rules for solving a pattern-based question :

- We always use nested loops for printing the patterns. For the outer loop, we count the number of lines/rows and loop for them.
- Next, for the inner loop, we focus on the number of columns and somehow connect them to the rows by forming a logic such that for each row we get the required number of columns to be printed.
- We print the '*' inside the inner loop.
- Observe symmetry in the pattern or check if a pattern is a combination of two or more similar patterns or not.

In this pattern, we run the outer loop for N times as we have to print N rows, and since we have to print a right-angled triangle/pyramid which must be upright, so the inner loop will run for the row number in each iteration. For eg: 1 number for row 1, 5 numbers for row 5, and so on. The only difference between this pattern and pattern 2 is that here we print **numbers** looping from 1 to the row number for each row instead of printing stars.

Code:

C++Java

```
#include <bits/stdc++.h>
using namespace std;

void pattern3(int N)
{
    // This is the outer loop which will loop for the rows.
    for (int i = 1; i <= N; i++)
    {
        // This is the inner loop which loops for the columns
        // no. of columns = row number for each line here.
        // Here, we print numbers from 1 to the row number
        // instead of stars in each row.
        for (int j = 1; j <= i; j++)
        {
            cout << j << " ";
        }
    }
}
```

```
        // As soon as numbers for each iteration are printed, we move  
to the
```

```
        // next row and give a line break otherwise all numbers
```

```
        // would get printed in 1 line.
```

```
        cout << endl;
```

```
    }
```

```
}
```

```
int main()
```

```
{
```

```
    // Here, we have taken the value of N as 5.
```

```
    // We can also take input from the user.
```

```
    int N = 5;
```

```
    pattern3(N);
```

```
    return 0;
```

```
}
```

Output

```
1  
1 2  
1 2 3  
1 2 3 4  
1 2 3 4 5
```
